Title : Cordiceps clavulata parasitism in relation to Eulecanium corni (Bouche)

Periodical : Mikrobiologiya, 23, 6, 702-705, Nov-Dec 1954

Abstract : The cause of the massive destruction of Eulecanium corni [a scale insect of the genus Lecanium] in Azerbaydzhan during 1950 and 1951 was the parasitic fungus Cordiceps clavulata. Artificially cultured Cordiceps clavulata were used to spray infected hazel nut trees, thereby reducing Eulecanium corni infestation by 80 to 90 percent. Experiments showed that Cordiceps clavulata could be cultured easily in the laboratory, and would pass through both conidial and ascosporic stages in culture media. The text is illustrated by a chart and four sketches. Five non-Soviet sources are cited.

Abstract : The result of a single study of the degree of fruit diseases is given for lower, middle and foothill ecologic zones in the Zakhatal rayon of Azerbaijan SSR. It is pointed out that in Azerbaijan SSR black canker are found not only in apple and pear trees, but also on apricot, maple, oak, rose, walnut and others.

AUTHOR: Bakharev, A. M.; Ibragimov, I.; Shodiyev, U.

TITLE: The mass of meteor matter falling to earth in a year

SOURCE: Vsesoyuznoye astronomo-geodezicheskoye obshchestvo. Byulleten', no. 34, 1963, 42-44

TOPIC TAGS: astronomy, meteor, meteor matter, telescopic meteor, stratosphere, meteor matter sedimentation, telescope

ABSTRACT: A new study has been made of the mass of meteor matter annually entering the earth's atmosphere. Visual observations of meteors made over a period of twenty years at Dushanbe were analyzed. The seven instruments used in these observations are described and observational data tabulated separately for each. The U. Shodiyev formula $\beta = \frac{5c}{m}x$ was used for determining the area of visibility of telescopic meteors from 7^m to 13^m for the various instruments. In this formula β is the apparent area of the field of view in square degrees in which telescopic meteors of a particular stellar magnitude were visible; x is instrument magnification; c is mean duration of the flight of telescopic meteors; m is the apparent stellar magnitude of telescopic meteors. The known exponential law $n'(m) = kn(m)$ was used, expressing change in the daily number of telescope meteors of different

Card 1/2

ACCESSION NR: AT4016602

brightness. In this formula $k = \frac{5}{8}$. The formula was used to determine the annual number of telescopic meteors for each instrument. Masses for each brightness group were computed from the number of meteors of each stellar magnitude. Total mass for all meteors from -10^m to $+30^m$ was determined to be $14 \cdot 10^3 - 51 \cdot 10^3$ tons annually. These data are close to former determinations, but considerably less than data from recent rocket investigations, but the authors fail to take into account that rocket data include micrometeorites, considerably smaller than telescopic meteors. Orig. art. has: 2 figures, 2 formulas and 2 tables.

Title : Problem of Withering in Poplar Plantings in Bashkir ASSR

Orig Pub : Tr. Bashkirsk, s.-kh. in-ta, 1957, No 2, 265-278

Abstract : Withering of the poplar stands in Bashkir ASSR was noted in 1951-1952, during which period there was a gradual decrease (from 1940) in atmospheric precipitation. Analysis of the structure of 16 year-old plants of balsam poplars showed that trees of smaller diameter generally dried out in the crowded part of the tree stand, and the waste according to the number of trunks consisted of 37.3%; plants of Chinese poplars on segregated plots

TITLE:

Some Limit Theorems for Stochastic Processes Stationary in the Strict Sense (Nekotoryye predel'nyye teoremy dlya statsionarnykh v uzkom smysle veroyatnostnykh protsessov)

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 125, Nr 4, pp 711-714 (USSR)

ABSTRACT: Let $\{x_j\}$, $-\infty < j < \infty$ be a process stationary in the strict sense with a discrete time assuming all integral values. Let \mathcal{M}_a^b , $-\infty \leq a < b-1 \leq \infty$ the σ -algebra of the events produced by the events $\{(x_{i_1}, \dots, x_{i_r}) \in E\}$; $a < i_1 < i_2 < \dots < i_r < b$, E - r-dimensional Borel set. The author considers processes for which with the probability 1 it holds:

$$(1) \quad \sup_{B \in \mathcal{M}_{k+1}^\infty} |P\{B | \mathcal{M}_{-\infty}^1\} - P\{B\}| \leq \varphi(k) \downarrow 0$$

or

$$(2) \quad \sup_{A \in \mathcal{M}_{-\infty}} |P\{AB\} - P\{A\} \cdot P\{B\}| = \tilde{\varphi}(k) \downarrow 0$$

 $B \in \mathcal{M}_{k+1}^\infty$

Card 1/3

Some Limit Theorems for Stochastic Processes
Stationary in the Strict Sense

SOV/20-125-4-5/74

((1)- regular and (2)- regular processes)

Theorem: Let $\{x_j\}$ be a (2)-regular process. The sequence of distribution functions $F_n(z) = P\{S_n < z\}$ may converge only with respect to stable laws. If the stable limit law for $F_n(z)$ has the exponent α , then $B_n = n^{1/\alpha} \gamma(n)$, where $\gamma(n)$ is a function slowly variable in the sense of Karamata.

The second theorem gives the necessary and sufficient conditions

that the distribution functions of the sums $\xi_n = \frac{x_0 + \dots + x_{n-1}}{B_n}$,

B_n - constants, converge to the normal distribution. The theorems 3 and 4 complete the theorem 2. Three further theorems on the limit behavior of the distribution functions of S_n are

Card 2/3

Some Limit Theorems for Stochastic Processes
Stationary in the Strict Sense

SOV/20-125-4-5/74

given. The results overlap with those of V.A.Volkonskiy and
Yu.A.Rozanov (Moscow). The author mentions S.V.Nagayev and
N.A.Sapogov.

There are 4 references, 2 of which are Soviet, 1 American, and
1 English.

Editorial Staff: G.I. Arbatskaya, P.Y. Gavrilov, Yu.V. Il'inski and
B. N. Tsvetkov; Ed. of Publishing House: A.G. Silant'; Publ. Mar. Min. Republik.

NOTES: The book is intended for mathematicians.

CONTENTS: The book contains 42 articles submitted to the Conference and dealing with
the theory of probability and mathematical statistics. Some of the articles are
the reports given at the Conference and others published in some journals, while others are in
the form of papers which appeared or are intended to appear in other
journals. In addition, publications in some cases, such publications are included in
the present ones, because it is believed that they are useful
for the reader. Individual articles contain theoretical
and practical applications of mathematics, methods, general and specific procedures,
discusses the behavior of random variables, Markov's chains, and various processes, the
theory and methods of estimation, distributions and their applications, a number of
statistical methods, statistical analysis, large-scale statistical distributions of plans,
statistical experiments, statistical methods and techniques, problems of
statistical series, especially of radio天文学 and detection problems of radio
signals. No personalities are mentioned. References and notes are included.

8/0043/64/000/001/0042/0057

AUTHOR: Ibragimov, I. A.; Tovstik, T. M.

TITLE: Evaluation of the spectral functions of one class of stationary random sequences

SOURCE: Leningrad. Universitet. Vestnik. Seriya matematiki, mehaniki i astronomii,
no. 1, 1964, 42-57

TOPIC TAGS: random sequence, stationary random sequence, statistics, spectral
analysis, spectral function, stochastic process

ABSTRACT: The paper considers the real, stationary, random sequence $\{x_j\}$:

$$x_j = \sum_{k=-\infty}^{\infty} a_{jk} f_{kj} \quad (1)$$

where the f_{kj} are independent, equally distributed random variables with zero mean and
finite variance. The correlation function of the sequence is denoted by R_{jk} , the correspond-
ing spectral function by $F(\lambda)$ and the spectral density by $f(\lambda)$. The asymptotic behavior
of the evaluation:

$$F_N(\lambda) = \frac{1}{2\pi N} \int \left| \sum_{j=1}^N x_j e^{-j\lambda} \right|^2 d\lambda \quad (2)$$

Card 1/3

ACCESSION NR: AP4018861

is studied for an unknown spectral function $F(\lambda)$, constructed from a sample of size N (x_1, \dots, x_N) taken from $\{x_j\}$. The measures P_N in $C[0, \pi]$ are generated by the random process $\xi_N(\lambda) = \sqrt{\pi} [F_N(\lambda) - F(\lambda)]$. The main theorem states that as $N \rightarrow \infty$ the sequence of measures P_N weakly converges to the measure P in $C[0, \pi]$ generated by the zero-mean, gaussian, random process $\xi(\lambda)$, under certain assumptions concerning x_j and $f(\lambda)$. In particular:

$$\lim_{N \rightarrow \infty} P \left\{ \max_{0 \leq \lambda \leq \pi} \sqrt{N} |F_N(\lambda) - F(\lambda)| < z \right\} = P \left\{ \max_{0 \leq \lambda \leq \pi} |\xi(\lambda)| < z \right\}. \quad (3)$$

This theorem is a further extension of the results obtained earlier by U. Grenander and M. Rosenblatt (Ann. Math. Statistics, 24, 537-558, 1953) and by one of the present authors (Ibragimov). The rest of the paper is devoted to additional proofs of this theorem, the study of the correlation function and the asymptotic normality of the finite distributions of the process $\xi_N(\lambda)$, and an evaluation of the moments $E|\xi_N(\lambda_2) - \xi_N(\lambda_1)|^2$.

AUTHOR: Ibragimov, I. A.

TITLE: On the conditions for strong intermixing in stationary gaussian processes

SOURCE: AN SSSR. Doklady, v. 161, no. 1, 1965, 33-36

TOPIC TAGS: intermixing, gaussian process, spectral frequency, coefficient of mixing

ABSTRACT: This article treats the properties of the spectral frequency $f(\lambda)$ of a stationary gaussian process $x(t)$, satisfying the condition for strong intermixing. The method adopted here involves study of the function $\Gamma(z)$ which is analytical within the circle (upper half-plane) associated with $f(\lambda)$. Cases are considered for discrete time and continuous time. In the case of discrete time we consider processes $x(t)$ with discrete time $t = 0, \pm 1, \dots$. Here, the coefficient of mixing is

$$\alpha(\tau) = \sup \left| \int_{-\infty}^{\infty} e^{i\tau\lambda} \varphi(\lambda) / f(\lambda) d\lambda \right|, \quad \tau = 0, 1, \dots \quad (1)$$

Card 1/2

L 3214-66

ACCESSION NR: AP5009211

3

where sup is taken over all continuous functions $\Phi(\lambda)$ which are extendable within the circle, for which $\int |\varphi(\lambda)|f(\lambda) d\lambda = 1$. In the second case we consider processes with continuous time, $-\infty < t < \infty$. The coefficient of mixing is

$$\alpha(\tau) = \sup \left| \int_{-\infty}^{\infty} e^{it\lambda} \varphi(\lambda) f(\lambda) d\lambda \right|, \quad \tau > 0. \quad (3)$$

where sup is taken over functions $\Phi(\lambda)$ which are analytically extendable in the upper half-plane and which satisfy the condition

$$\int |\varphi(\lambda)|f(\lambda) d\lambda = 1.$$

Theorems are developed for both cases.

 TITLE: Rate of convergence to normal distribution

SOURCE: AN SSSR. Doklady, v. 161, no. 6, 1965, 1267-1269

TOPIC TAGS: normal distribution, distribution function, characteristic function

ABSTRACT: The sequence $\xi_1, \xi_2, \dots, \xi_n$ studied consists of identically distributed random variables with a common distribution function $F(x)$ and characteristic function $f(t)$. $F(x)$ is assumed to belong to the region of attraction of the normal law

$$\Phi(x) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^x e^{-s^2/2} ds.$$

In this case ξ_j have a finite initial moment and it is assumed that $E\xi_j = 0$.
 $F_n(x)$ is the distribution function of

$$S_n = \frac{\xi_1 + \dots + \xi_n}{B_n} - A_n,$$

which is normed so that $F_n(x) \rightarrow \Phi(x)$. Necessary and sufficient conditions are given for the theorem

$$\sup_x |F_n(x) - \Phi(x)| = O(n^{-\delta}), \quad 0 < \delta \leq 1.$$

TITLE: On the accuracy of approximating the distribution functions of sums of independent values by a normal distribution

SOURCE: Teoriya veroyatnostey i yeye primeneniya, v. 11, no. 4, 1966, 632-655

TOPIC TAGS: distribution function, probability, normal distribution, Gaussian distribution, approximation, periodic function, sequence

ABSTRACT: The sequence of independent identically distributed random values $\xi_1, \xi_2, \dots, \xi_n$... with a common distribution function $F(x)$ and characteristic function $f(t)$ is examined in this article. When $n \rightarrow \infty$,

$$\hat{F}_n(x) = P\left\{\frac{\xi_1 + \dots + \xi_n}{B_n} - A_n < x\right\} \rightarrow \frac{1}{\sqrt{2\pi}} \int e^{-u^2/2} du = \Phi(x). \quad (1)$$

The asymptotic behavior of the difference $F_n(x) - \Phi(x)$ when $n \rightarrow \infty$ is studied. The main theorems are as follows. In order that

$$\delta_n = \inf_{A_n, B_n} \delta_n(A_n, B_n) = O(n^{-\alpha}) \quad (2)$$

Card 1/2

ACC NR: AP7004273

for any $0 < \delta < 1$ when $n \rightarrow \infty$, it is necessary and sufficient that

$$\int_{-\infty}^{\infty} x^{\delta} dF(x) < \infty, \quad (3)$$

$$\int_{|x|>s} x^{\delta} dF(x) = O(s^{-\delta}), \quad s \rightarrow \infty.$$

In order that

$$\delta_n = O(n^{-1}), \quad (4)$$

it is necessary and sufficient that (3) and

$$\int_{-\infty}^s x^{\delta} dF(x) = O(1), \quad s \rightarrow \infty. \quad (5)$$

Similar local theorems are also examined. Orig. art. has: 61 formulas.

Pribory avtomaticheskogo kontrolya i regulirovaniya khimicheskoy i neftepererabatyvayushchey promyshlennosti (Instruments for Automatic Control and Regulation in the Chemical and Petroleum Refining Industries) Baku, Azerneftneshr, 1959. 194 p. 2,000 copies printed.

Ed.: A.I.Aleskerova; Ed. of Publishing House: A.S.Shteyngel'.

PURPOSE: This book is intended for engineers and technicians of the chemical and petroleum refining industries. It may also be useful to students of schools of higher education and teknikums.

COVERAGE: The methods and instruments for the automation of various production processes in the chemical and petroleum refining industries are reviewed. Different types of electronic potentiometers, electronic balanced bridges, and manometers are described. Equations used for determining the flow coefficient, dynamic and kinetic viscosity of the flow, diameters of tubes, and other parts of equipment are also presented along with descriptions and designs of different types of differential flow meters and automatic controllers. A number of automatic remote control systems used in the Soviet Union are also described. No personalities are mentioned. There are 83 references, all Soviet.

TITLE:

Automatic Control and Regulation of the Plant for the Redistillation of a Wide Gasoline Fraction (Avtomaticheskiy kontrol' i regulirovaniye ustanovki vtorichnoy peregonki shirokoy benzinovoy fraktsii)

PERIODICAL:

Izvestiya vyoshikh uchebnykh zavedeniy. Neft' i gaz, 1959, Nr 1, pp 97 - 103 (USSR)

ABSTRACT:

Present schemes of automatic control and regulation of plants for the redistillation of a wide gasoline fraction are based on the use of tools and controllers, by which the individual parameters are measured and controlled. The attempt is made here to determine the interrelations of the parameters to be controlled with the establishment of schemes of a coupled control of the plant parameters. The parameters to be controlled are: 1) consumption of raw material entering the plant; 2) temperature of the column upper part; 3) level of the column lower part; 4) temperature of the column lower part; 5) temperature of the second raw material supply;

Card 1/2

Automatic Control and Regulation of the Plant for the Redistillation of a Wide Gasoline Fraction SOV/152-59-1-24/31

6) vapor pressure at the condenser outlet; 7) temperature when the product is leaving the condenser; 8) water level in the water separator; 9) water level in the scrubber; 10) gasoline level in the water separator; 11) gasoline level in the scrubber. The parameters in 1), 3), 5), 6), 7), 8), and 9) are controlled individually and the automatic controllers and connecting appliances suggested for the control are shown in a table. For the control of the parameters in 2), 4), 10) and 11) methods are suggested which are more closely described here. The application of these methods permits the quality and the economy of the control to be improved. This is brought about by timely impulse supplies to the controller and by the diminution of the harmful influence caused by delays in measuring and controlling. There are 3 figures, 2 tables and 2 Soviet references.

TITLE: Complete regularity of multidimensional stationary processes with discrete time

SOURCE: AN SSSR. Doklady, v. 162, no. 5, 1965, 983-985

TOPIC TAGS: vector, mathematic analysis

ABSTRACT: This paper is a study of the conditions that must be imposed on a stationary process $f(\lambda)$ in order to obtain a certain rate of diminution of the mixing coefficient. Since every completely regular process is regular, its stationary process $f(\lambda)$ has a constant rank $m \leq n$ for almost all $\lambda \in [-\pi, \pi]$. Also examined are processes of full rank $m = n$, as well as degenerate processes $m < n$. All proofs are based on the analytical equation

$$a(r) - a(r; f) = \sup_{\tilde{\psi}, \tilde{\phi}} \left| \int e^{ir} (f(\lambda) \tilde{\phi}(\lambda), \tilde{\psi}(\lambda)) d\lambda \right|,$$

where, in general, $(A \tilde{\alpha}, \tilde{\beta}) = \sum \alpha_k \beta_k \delta_j$, and sup is taken over all

L 28912-66

vectors $\vec{\varphi}(\lambda)$, $\vec{\psi}(\lambda)$, all coordinates φ_k , ψ_i of which are elements of the Hardy space H_1 , and

$$\int (I(\lambda)\vec{\varphi}(\lambda), \overline{\vec{\varphi}(\lambda)}) d\lambda = \int (I(\lambda)\vec{\psi}(\lambda), \overline{\vec{\psi}(\lambda)}) d\lambda = 1.$$

TITLE: Structural-simulator study of stability and transients in an automatic
two-coordinate recorder

SOURCE: IVUZ. Priborostroyeniye, v. 7, no. 1, 1964, 32-38

TOPIC TAGS: recorder, two coordinate recorder, electronic simulator,
recorder stability, recorder transients

ABSTRACT: An automatic high-speed two-coordinate recorder (see block
diagram in Enclosure 1) consists of two autonomous identical measuring
followers which operate on the self-compensation principle; the recorder permits
the registration of input a-c and d-c voltage signals. The measurand is compen-
sated by a voltage taken from a rheochord whose cursor is moved by a reversible

Card 1/32

ACCESSION NR: AP4018994

two-phase type RD-09 induction motor; the difference between the measurand and the rheochord voltage drives the motor. Two versions of the recorder were investigated on an MPT-9 electronic structural simulator: (a) with a speed-type feedback correction and (b) with a disturbance-type differentiating circuit. These results are reported: (1) The differential unit considerably improves the transient characteristics of the recorder; (2) The best values for several design coefficients have been determined (reported in the article); (3) With these optimum values, the overshoot was within 0-3.9% and the time for getting the output into the $\pm 2\%$ stabilization range was under 0.15 or 0.20 sec. Orig. art. has: 4 figures, 18 formulas, and 4 tables.

| TITLE: Some problems encountered in the investigation of the stability of dynamic systems using electronic structural models | | |
| SOURCE: Za tekhnicheskiy progress, no. 10, 1965, 13-17 | | |
| TOPIC TAGS: <i>Computer</i> , <i>program</i> , analog system, dynamic system, linear automatic control system, nonlinear automatic control system, control system stability | | |
| ABSTRACT: Three factors must be correlated during an investigation, by means of a structural model, of the stability of a <u>dynamic system</u> according to its mathematic description: the stabilities of the initial physical system, the solution to mathematical equations, and the machine solution. The present article is dedicated to an analysis of the interrelationship between the three aspects of the stability of an automatic control system (ACS). It is found that analytical methods of investigating the stability of high-order linear systems and those with variable coefficients require cumbersome calculations, whereas an investigation of the stability of nonlinear systems involves considerable difficulties. Structural models may help considerably in performing the analysis. An investigation of the stability of ACS with one nonlinear component according to the method of Gille-Wegvyn is based on reducing a nonlinear system | | |
| Card 1/2 | UDC: 681.142.5:62--501.72.001.5 | |

L 41020-66

ACC NR: AP6021365

to a variable-parameter linear system. An investigation of such a system on a model produces fast and high-quality results. Effective use of electronic structural models for the investigation of the stability of ACS is possible only by taking into consideration the analog system itself. The machine instability of an analog system does not always indicate the instability of the physical system. The absence of positive feedback in the analog system does not signify that the physical system is stable; the reverse is also true. Orig. art. has: 4 formulas and 3 figures.

TITLE: Experimental investigations of axisymmetric semi-infinite jet in wake flow

SOURCE: AN KazSSR. Vestnik, no. 4, 1964, 83-89

TOPIC TAGS: jet aerodynamics, pitot probe, concentric nozzle, wake flow, turbulent jet, friction coefficient, velocity profile, axisymmetric jet

ABSTRACT: An experimental investigation has been conducted on semi-infinite jet aerodynamics in the Thermophysics Laboratories at the Khazakh Scientific Research Institute of Power Engineering. The study involved the turbulent jet generated along cylindrical walls in wake flow. The experimental equipment consisted of two concentric nozzles with the jet issuing from a circular slit along cylindrical rods coaxial with the nozzle walls. Profile measurements were made using pitot probes. The results are represented graphically in terms of excess velocity, $u - u_{\text{flow}}$, profiles, both transverse and longitudinal in the jet for various parameters $m = u_{\text{flow}}/u_{\text{jet}}$. From two-dimensional hydrodynamic considerations an expression is derived for the turbulent friction coefficient in the semi-infinite jet for a

Card 1/2

ACCESSION NR: AP4039226

velocity profile given by $u/u_m = 0.16 \gamma^{1/2} e^{-\gamma \eta}$, where $\gamma = \frac{v}{dx}$. The results show that increasing γ has the effect of increasing the jet decay rate. Orig. art. has 8 formulas and 4 figures.
